

Dear Valued Lube USA & Lube Corp. Customer,

As a user of our grease products, we recommend to keep no more than a few month's supply of grease on hand. Our grease has a shelf life due to the natural proclivity of grease to separate into its base oil and solids over time. We advise that there is a normally a ONE YEAR shelf life of our grease products from the date of receipt, if kept in an environmentally controlled location that is cool (65-75°F/18-24°C) and is out of direct sunlight.

We would like to also inform you that our greases officially have a 2-year shelf life from the date of manufacture. Most greases are only a few weeks old when they arrive into the US, but some can already be six months old, such as our FS2 and MY2 greases that are filled in the USA. Some greases can be stored for several months before they are shipped to customers; therefore we cannot guarantee the full 2-year life from manufacture.

We recommend that you rotate your stock to use the oldest grease first. To check your grease's age, check the label on the bottom of the cartridge, it will the month & year printed on the label or will have a lot number. Greases filled in Japan will have a lot number and greases filled in the USA will have the month and year.

Lot numbers have a single number and letter. The number refers to the year of filling and the letter refers to the month. E.g. 6M = December 2016; 5A = January 2015. If you need help interpreting lot numbers, please contact us.

We at Lube USA are committed to providing you the best lubrication products available and welcome any questions or comments you may have.
